#### **DETAILED ACTION**

## Allowable Subject Matter

- 1. Claims 1-14 and 21-30 allowed.
- 2. The following is a statement of reasons for the indication of allowable subject matter:

  Prior art failed to establish antifuse device with the required tunneling region.

## Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 15-20 rejected under 35 U.S.C. 103(a) as being unpatentable over McCollum (US 2002/0075744) in view of Zhang (5,835,396).

Regarding Claims 15-20, McCollum discloses an antifuse memory and antifuse memory cell array where in Fig. 2, it's disclose a first antifuse 14 having a first electrod and a second electrode where the second electrode of the first antifuse connect to the first programming and bias input, a second antifuse 16 having a first electrode and a second electrode where the first electrode of the second antifuse element connected to first electrode of the first antifuse and a node 18 is placed between the first and the second antifuses 14 and 16, and the second electrode of the second antifuse 16 is connected to second programming bias input. McCollum, fails to disclose the required conductivity/non-conductivity of the antifuse structures. However, Zhang discloses a three-dimensional read-only memory structure where in Claim 8 it is disclosed that an

antifuse layer between a firs and the second electrodes where the antifuse layer being non-conductive when antifuse layer is unprogrammed and the antifuse layer being conductive when the antifuse layer is programmed

It would have been obvious to one of having ordinary skill in the art at the time the invention was made to include the required conductive/non-conductive programmability in McCollum as taught by Zhang in order to have an antifuse device with better flexilibility.

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Fazli Erdem whose telephone number is (703) 305-3868. The examiner can normally be reached on M - F 8:00 - 5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nathan Flynn can be reached on (703) 308-6601. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the ElectNATHABUSTICENTECTION CENTER (EBC) at 866-217-9197 (toll-free).
